# My Question

How did poisonous snakes get  
poison in them?

# 800 Species

Venomous snakes include several families of snakes and do not form a single taxonomic group. Venomous snakes are often said to be poisonous, although this is not the correct term, as venoms and poisons are different. Poisons can be absorbed by the body, such as through the skin or digestive system.

# Poisonous Snakes

- Coral Snake
- Baby Diamondback Rattlesnake
- American Copperhead
- King Cobra
- Anaconda
- Black Mamba
- Bushmaster

# Where some of the main snakes live.

- The poisonous snakes live on the forest floor of the Amazon Rainforest in South America. It is a very dense tropical forest covering about 5,117,258.95 square mile.
- The poisonous snakes also spend much if not most of their time in the rivers, lakes and marshes.

# The Answer to the Question

When the snake eats some thing poisonous it gets the venom from it.
